INAV mapping

INAV Tips:

- **INAV firmware “MATEKF405SE” must be 6.0.0 or newer version.**
- Current sensor scale 150
- 5x Vx2 pads on S5~S9 rails are dead pins, If powering servos of S5~S9 rails with the built-in Vx BEC, bridge Vx2 to Vx pad with a drop of tin. If powering servos of S5~S9 rails with an external BEC, keep the gap open, you may connect external BEC to any pair of Vx2/G.
- **Softserial_tx1 is enabled on Tx2 pad by default for Frsky SmartPort telemetry. If using CRSF protocol receiver(TBS, ELRS etc), CPU based serial port(softserial) should be disable in INAV configurator.**
- GPS / DJI OSD and other digital video systems / CRSF protocol receiver can work with anyyyyyyy spare UART_TX & RX.
- Airspeed sensor MS4525 works on I2C2 bus only.

Ardupilot mapping

ArduPilot Tips:

- **ArduPlane firmware “MatekF405-WING” must be 4.4.0 or newer version.**
- BATT_AMP_PERVLT 66.7
- Use 5V active buzzer on “Buz-” and 5V pads, Tone alarm is not supported.
- 5x Vx2 pads on S5~S9 rails are dead pins, If powering servos of S5~S9 rails with the built-in Vx BEC, bridge Vx2 to Vx pad with a drop of tin. If powering servos of S5~S9 rails with an external BEC, keep the gap open, you may connect external BEC to any pair of Vx2/G.
- non-inverted (hacked) S.Port signal is required for FPort or Smartport telemetry.
- If sending highspeed serial data (eg. 921600 baud) to the board, use USART1(Serial1) .

Mixing Dshot and normal PWM operation for outputs is restricted into groups, ie. enabling Dshot for an output in a group requires that ALL outputs in that group be configured and used as Dshot, rather than PWM outputs.

If servo and motor are mixed in same group, make sure this group run lowest PWM frequency according to the servo specification. ie. Servo supports Max. 50Hz, ESC must run at 50Hz in this group.
